

Case Study · Sustainability & Green Tech · Commercial Strategy

A mission worth funding.

A business worth backing.

How a green tech venture translated environmental impact into commercial traction, secured enterprise adoption, and built the revenue model that made its mission sustainable — with **Stralchemistry**.

BACKGROUND

A green tech venture developing IoT-based energy monitoring and optimisation solutions for commercial buildings had built technology that genuinely worked — independently verified energy savings of 28–35% for pilot clients, a hardware-software stack with real defensibility, and a founding team that combined deep engineering capability with genuine environmental conviction. Three years in, the business remained reliant on grant funding and pilot contracts that failed to scale commercially. Every investor conversation stalled at the same question — where is the repeatable revenue? The founders knew their technology could change how buildings consume energy. What they didn't know was how to sell it.

Stralchemistry was brought in to build the commercial engine the technology deserved.

PAINPOINTS

Four commercial gaps were keeping a technically validated product from achieving the scale its impact potential demanded:

Impact first, revenue-last positioning

The founding team led every conversation with carbon reduction and ESG credentials - compelling to values-aligned buyers but structurally insufficient for procurement teams whose primary mandate was ROI. The commercial case for the product existed but was never being made first.

Pilots that never converted

Seven pilot deployments had been completed with positive results. None had converted to a full commercial contract. There was no structured pathway from pilot to paid, no commercial milestone framework, and no escalation strategy when pilots stalled in procurement.

No enterprise sales capability

Selling IoT infrastructure to large commercial real estate or corporate campus operators requires navigating facilities managers, sustainability heads, CFOs, and procurement - simultaneously. The founding team had the product knowledge but none of the multi-stakeholder enterprise sales discipline required to close.

Revenue model misaligned with buyers

The pricing model required significant upfront capital expenditure - a structural barrier for budget-constrained facilities teams. An outcomes-based or subscription pricing model had never been explored, despite being standard in adjacent verticals and far better suited to the buyer's procurement reality.

THE STRALCHEMY ENGAGEMENT

Stralchemy ran a 14-week commercial strategy engagement covering go-to-market positioning, revenue model redesign, enterprise sales architecture, and pilot conversion strategy. The founding team's mission and technical credibility were treated as competitive advantages throughout — the engagement was built to translate them into commercial language without diluting them.

1. ROI-First Positioning Without Abandoning Mission

Stralchemy reframed the commercial narrative — leading with a quantified financial return (average payback period of 22 months, guaranteed energy savings of 28%), and positioning ESG impact as the additional value layer rather than the primary hook. The product became a CFO-approved decision, not just a sustainability team aspiration. Pilot conversion conversations changed tone immediately.

2. Pilot-To-Paid Conversion Framework

A structured 90-day pilot programme was designed with commercial milestones built in from day one — a defined success metric, a mid-point review with procurement included, and a contract-ready proposal delivered at day 75. Seven existing stalled pilots were re-engaged using the new framework. Four converted to full contracts within 60 days of the framework going live.

3. Enterprise Sales Architecture

Stralchemy mapped the buying committee for target enterprise accounts — facilities, sustainability, finance, and procurement — and built a stakeholder engagement strategy for each. A multi-threaded outreach playbook, an objection handling guide, and a procurement-ready contract template were built and handed to the founding team as operational assets. The first enterprise account closed using the playbook within six weeks.

4. Energy-As-A-Service Pricing Model

Stralchemy designed an outcomes-based subscription model — zero upfront hardware cost, a monthly fee structured as a share of verified energy savings. Buyers eliminated capital expenditure risk; the venture gained predictable recurring revenue. The new model opened access to buyers previously constrained by the old pricing structure, driving a 2.4× increase in average deal size.

OUTCOMES

Pilots finally converting

Four of seven stalled pilots converted to full commercial contracts within 60 days of the new framework. The pilot-to-paid conversion rate moved from near-zero to 71% within two quarters - the single most significant commercial shift in the company's history.

Enterprise pipeline open

Fourteen enterprise clients were signed within 12 months of the go-to-market restructure. The multi-stakeholder sales playbook allowed the founding team to navigate procurement processes they had previously abandoned as too complex.

Revenue model that remove barriers

The energy-as-a-service pricing model eliminated the capex objection that had blocked 60% of prospects. ARR grew 3.6x within 11 months - driven equally by new client acquisition and expanded deployments from existing accounts.

Series A closed on commercial proof

The Series A was raised within 14 months of the **Stralchemy** engagement - led by a climate-focused fund. The investor pitch was built directly on the commercial metrics the engagement had generated: repeatable revenue, proven conversion, and a scalable go-to-market model.

"We always believed the technology could change how the world uses energy. **Stralchemy** helped us recognize that belief alone does not secure enterprise contracts – rigorously building the commercial case is itself an expression of mission."
