Great product.

Leaking revenue.

How a B2B SaaS company fixed its churn problem, restructured its pricing, and unlocked enterprise growth it had been sitting on — with **Stralchemy**.

BACKGROUND

A B2B SaaS company serving mid-market operations teams had built a product its users genuinely loved. NPS scores were high, feature adoption was strong, and the founding team had deep technical credibility. But the business metrics told a different story — monthly churn was quietly erasing new MRR as fast as sales could add it, pricing was undervalued and inconsistent, and the path to enterprise contracts felt blocked despite several warm opportunities. The founders were technically exceptional and commercially overwhelmed.

Stralchemy was brought in to build the go-to-market discipline the product deserved.

PAINPOINTS

Four interconnected commercial failures were undermining a technically strong product:

Churn erasing growth

Monthly churn of 8.4% meant the business was losing nearly all its ARR within a year. New customer acquisition was masking the leak - not fixing it. The root cause was a broken onboarding experience, not product fit.

Pricing left to chance

Pricing had been set at launch and never revisited. Tiers were feature-based, not value-based - meaning customers who extracted enormous ROI paid the same as light users. Significant revenue was being systematically left uncaptured.

No enterprise motion

Several enterprise prospects had expressed interest, but none had closed. The team had no security documentation, no procurement-ready contracts, no champion-building playbook - and no one knew how to run a 90-day enterprise sales cycle.

Product-led, not market-led

Roadmap decisions were driven by engineering preferences and vocal user requests, rather than by segments with the highest growth and retention potential. The product was being built for the loudest users, not the most valuable ones.

THE STRALCHEMY ENGAGEMENT

Stralchemy ran a focused 12-week commercial strategy engagement covering churn, pricing, enterprise readiness, and market segmentation. The work was done alongside the founding team — not handed to them as a report to implement alone.

1. Churn Diagnosis & Onboarding Redesign

A cohort-level churn analysis identified the precise drop-off point — day 14, when users who hadn't completed a core workflow went silent. **Stralchemy** redesigned the onboarding sequence around that single milestone: a guided activation flow, a human check-in trigger at day 7, and an automated intervention for at-risk accounts. Churn fell from 8.4% to 2.1% within two quarters.

2. Value-based Pricing Overhaul

Stralchemy conducted a willingness-to-pay analysis across customer segments and rebuilt the pricing architecture around outcomes delivered — not features unlocked. A usage-based expansion tier was introduced for high-ROI accounts. Average contract value more than doubled without a single feature change.

3. Enterprise Readiness Programme

A 60-day sprint produced the full enterprise sales kit — security questionnaire responses, MSA templates, procurement-compatible SLAs, and a multi-stakeholder engagement playbook. Two pipeline opportunities that had been stalled for six months closed within weeks of the materials going live.

4. Segment-Led Roadmap Framework

Stralchemy facilitated a segmentation workshop that identified the two customer profiles with highest LTV and lowest churn. A lightweight prioritisation framework was introduced — giving the product team a commercial lens to apply to every roadmap decision without losing engineering autonomy.

OUTCOMES

Churn under control

Monthly churn dropped from 8.4% to 2.1% - transforming the unit economics of every new customer acquired. Net revenue retention crossed 108% within two quarters of the onboarding redesign.

Pricing that captures value

Average contract value grew 112% without increasing the sales team or changing the product. Expansion revenue from the new usage tier contributed 29% of MRR growth by month eight.

Enterprise channel open

Three enterprise contracts closed within 90 days of the readiness sprint. The largest was 18x the previous average deal size - and came from a lead that had been sitting idle in the CRM for seven months.

ARR compounding cleanly

With churn contained and ACV up, ARR grew 2.9x in 11 months. The business entered its Series A process with metrics that told a coherent, investor-ready story for the first time.

“We had built something people loved and somehow still couldn’t grow. **Stralchemy** showed us the gap between a good product and a good business - and then closed it with us”
